

EXAMPLE Table below gives the activities (3) of a project, their predecessor(s) and their durations.

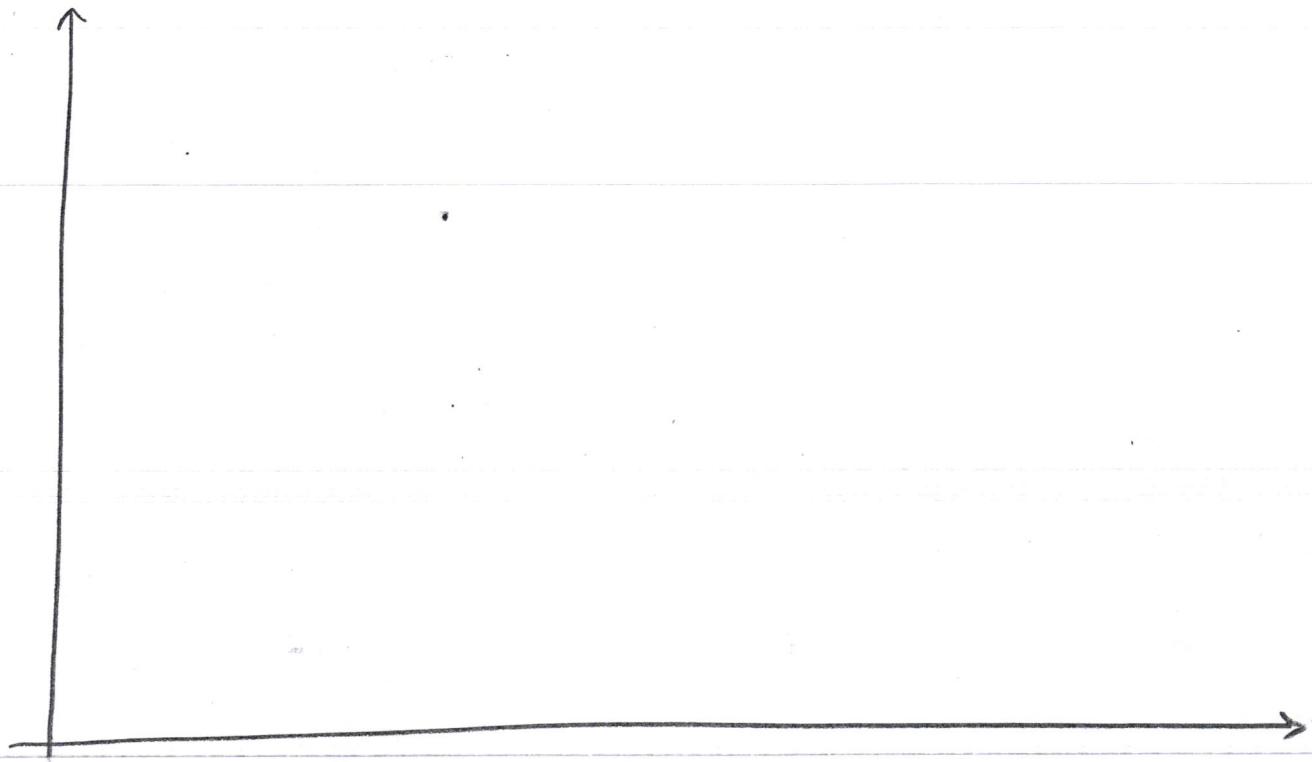

- Draw the network for the project.
- Determine the critical path.
- Construct the time schedule.
-

| <u>Activity</u> | <u>Predecessor(s)</u> | <u>Duration</u> | | <u>Cost</u> | | <u>Slope</u> |
|-----------------|-----------------------|-----------------|-------------|---------------|-------------|--------------|
| | | <u>Normal</u> | <u>Fast</u> | <u>Normal</u> | <u>Fast</u> | |
| A | - | 4 | 2 | 100 | 160 | 30 |
| B | - | 5 | 5 | 200 | 200 | - |
| C | - | 7 | 4 | 250 | 310 | 20 |
| D | A | 7 | 5 | 180 | 210 | 15 |
| E | B | 6 | 6 | 120 | 120 | - |
| F | C | 8 | 4 | 150 | 250 | 25 |
| G | C | 9 | 6 | 200 | 320 | 40 |
| H | E, F | 4 | 3 | 160 | 220 | 60 |
| I | E, F | 6 | 5 | 240 | 300 | 60 |
| J | E, F, D | 10 | 5 | 150 | 350 | 40 |
| K | H, G | 5 | 5 | 250 | 250 | - |

Time schedule

(4)

Critical Activities $\Rightarrow C - F - J$

Their slope $\Rightarrow 20^{\oplus} - 25 - 40$

Activity C has the minimal slope, thus it must be shorter. But how much??

Crashing amount = min { Maximal crashing amount of activity C, Free Floats of Alternative Noncritical paths }

Alternative non-critical paths

1) starts from the same or backward event with activity C.

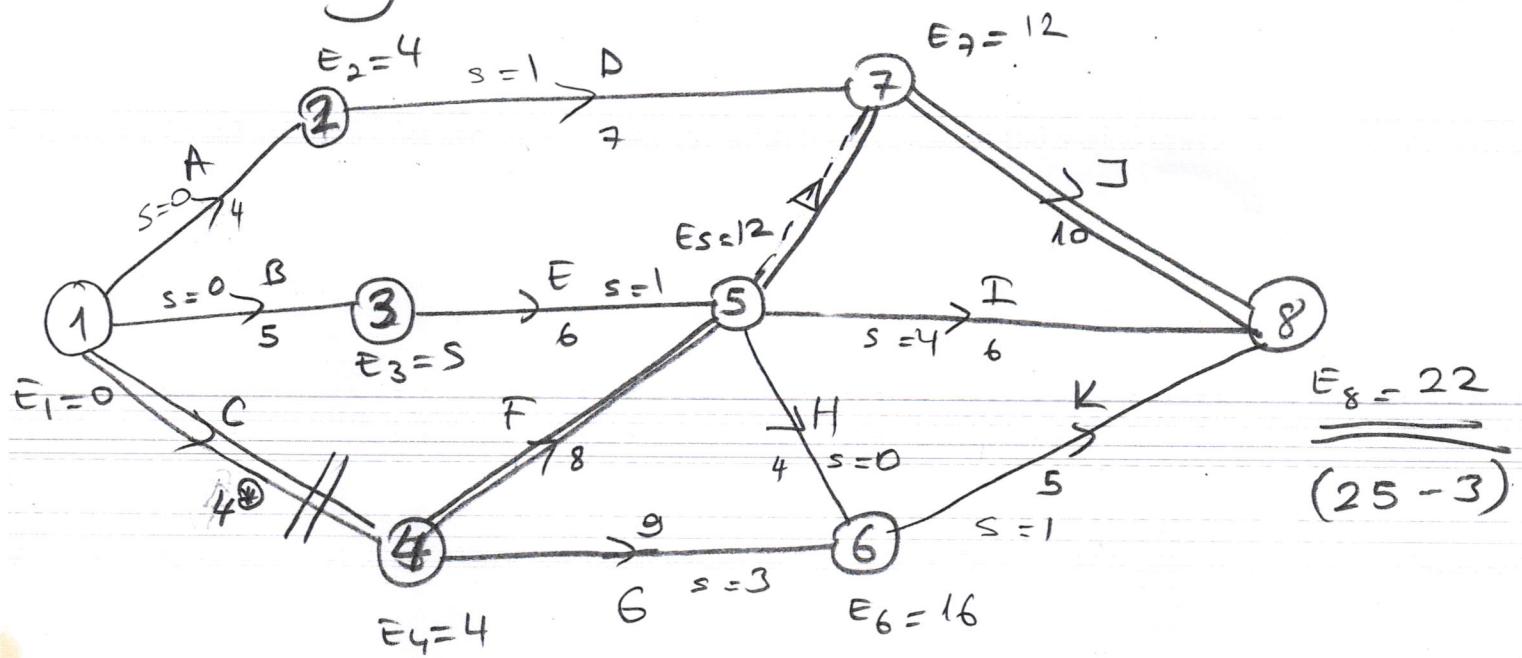

2) leads to the critical path(s).

Alternatif yolların kritik yol oluyor mu?

İşin gitmeden başlangıçtan bitişe gidebilen yol = alternatif yol

Crashing Amount of Activity C = min $\left\{ \begin{array}{l} \overbrace{7-4}^3, \overbrace{0+4}^{A-D}, \overbrace{0+4}^{BE} \end{array} \right\}$ (5) $= 3$
 Crashing limit of Activity C. unit

⇒ Activity C will be shorter 3 units.

(Pr 1)

Critical Paths = C - F - J

Total Duration = 22

Total Cost = $2000 + 20 \times 3 = \underline{\underline{2060}}$

Activity C reached its crashing limit, thus it can not be shortened anyway. We denote this with "||" on the relevant activity.

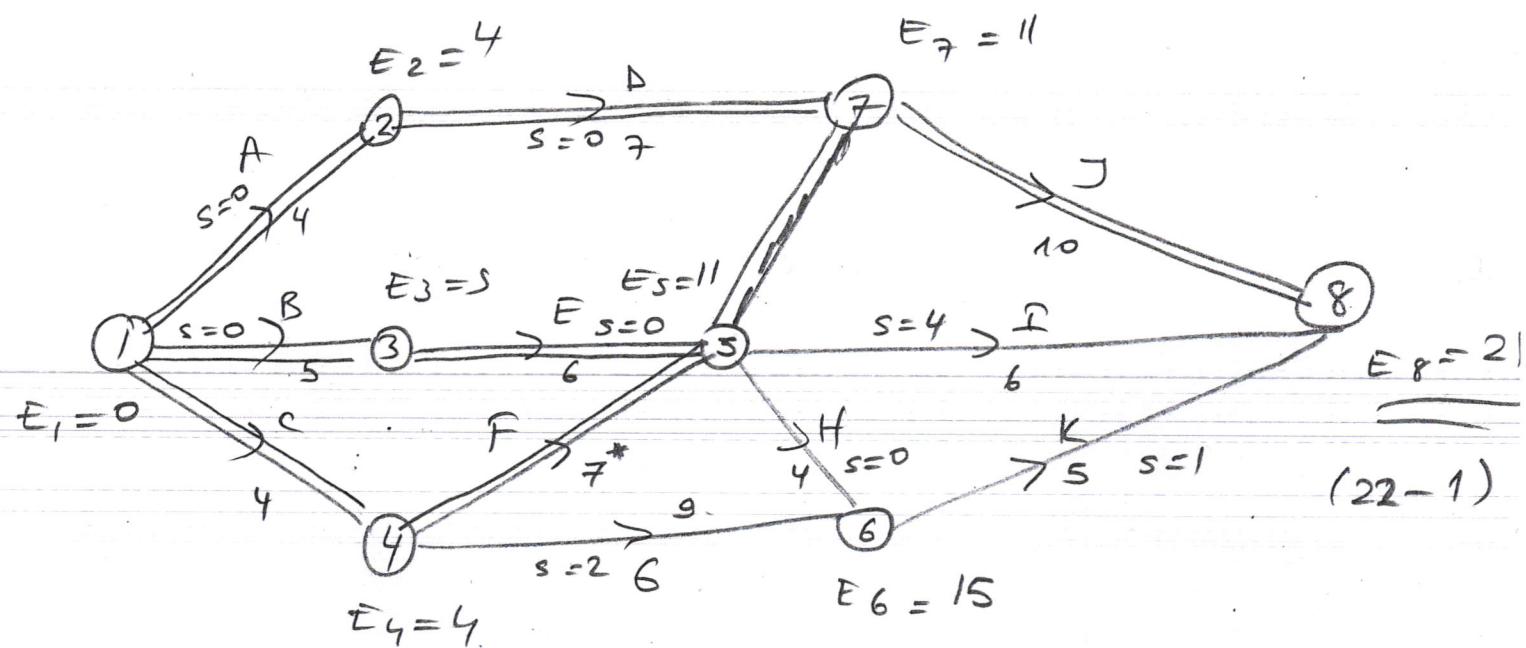

C - F - J Activity F has the minimal slope, thus it must be shorter.
~~X~~ - $25^{\oplus} - 40$

(6)

Crashing Amount of Activity F = $\min \left\{ \frac{8-4}{4}, 3+1, 0+1, 0+1 \right\}$
 F, GK, BE, AP

= 1 unit.

\Rightarrow Activity F will be shorter 1 unit.

(Pr 2)

Critical Paths = $\{ A - F - J, A - D - J, B - E - J \}$

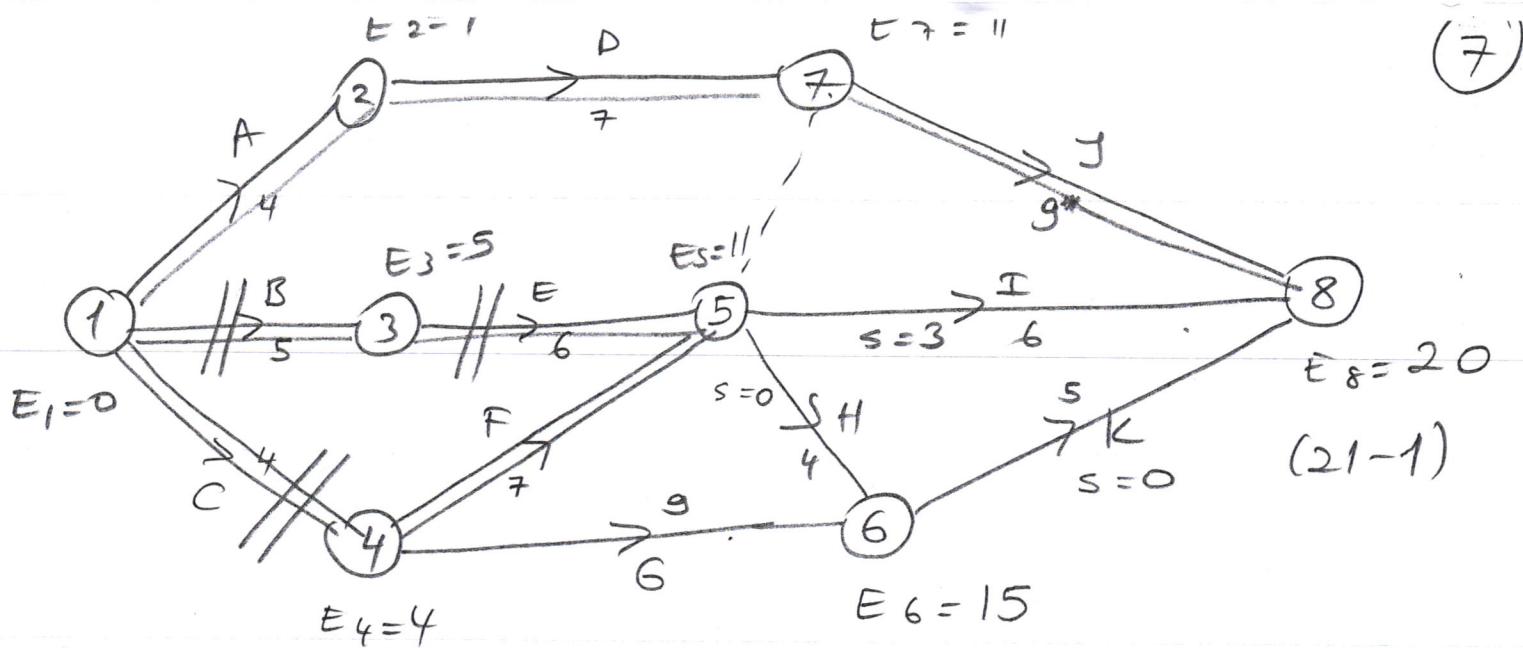

Activity J will be shortened.

Total Duration = 21

Total Cost = $2060 + 1 \times 25 = 2085$.

Crashing Amount = $\{ J, I, J - K \} = 1$ unit.

Activity J will be shortened 1 unit.

(Pr 3)

X - F - J

X - X - J

A - D - J

X - X - H - K

X - F - H - K

Possible crashing activities

J - H / J - K

40 + 60 / 40 + X

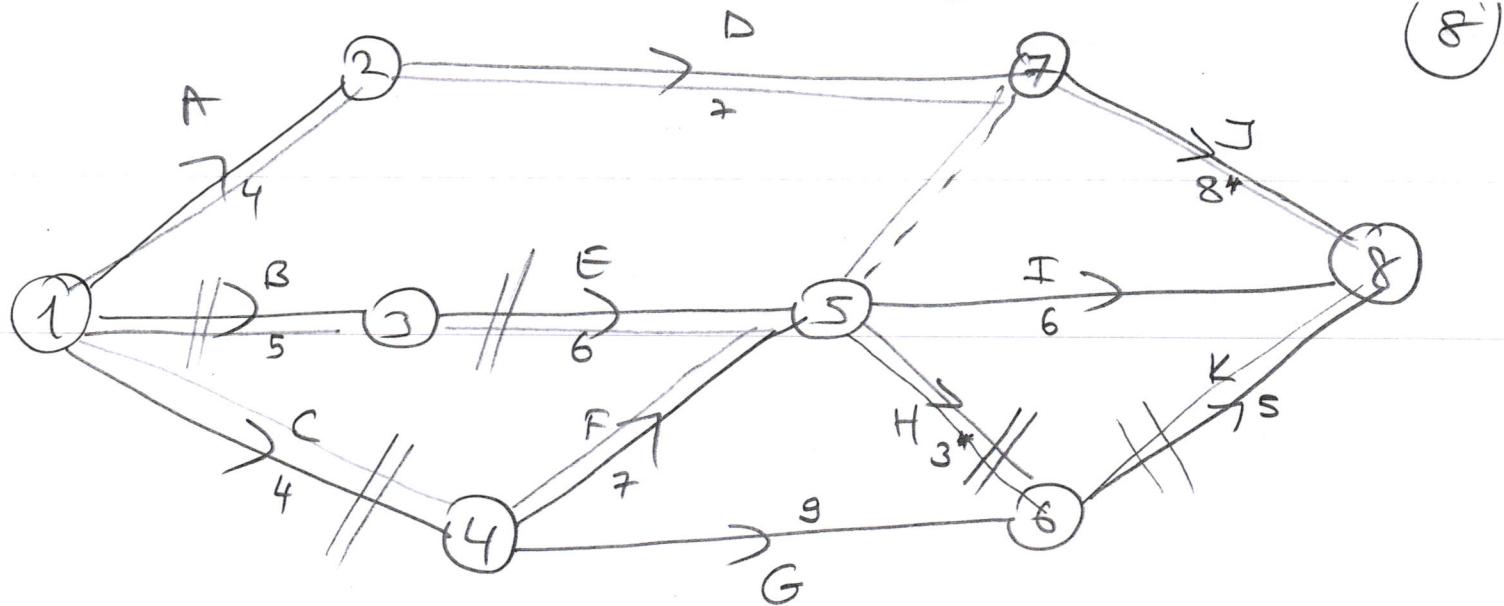

Total Duration 20 = 100.

$$2085 + 40 \times 1 = 2125.$$

Activities J and H will be shorter.

Crashing Amount of J and H = $\min \left\{ \frac{g-5}{4}, \frac{4-3}{1} \right\} = 1$ unit.

Activities J and H will be shorter 1 unit

(Pr 4)

Since the critical path BETHK is reached its crashing limit, it is not possible to shorten the total project duration. Thus crashing process is over.

Homework (CPM-4)

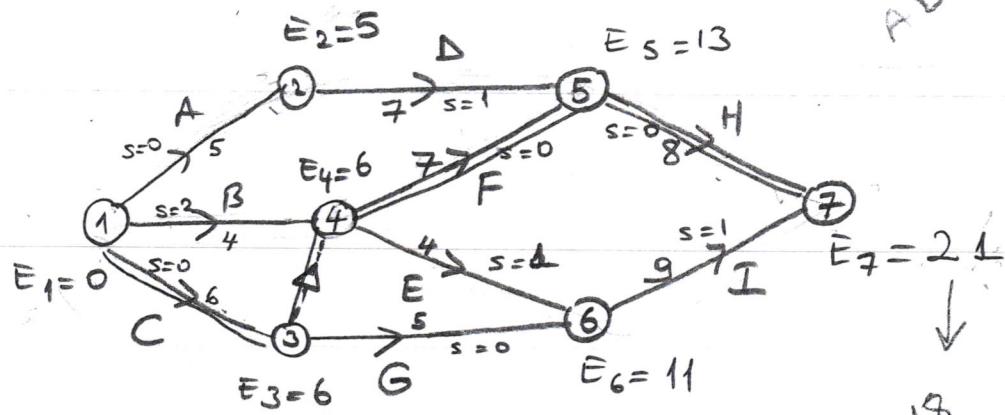

Table on below gives the activities of a project, their predecessor(s), durations and costs.

- Draw the network for the project.
- Determine the critical path.
- Construct the Time Schedule. → E, L
- Obtain programs with minimum costs.

| Activities | Predecessor(s) | Durations | | Costs | |
|------------|----------------|-----------|---------|--------|---------|
| | | Normal | Crashed | Normal | Crashed |
| A | -- | 5 | 3 | 100 | 150 |
| B | --- | 4 | 2 | 180 | 200 |
| C | --- | 6 | 3 | 170 | 200 |
| D | A | 7 | 5 | 200 | 260 |
| E | B, C | 4 | 4 | 120 | 120 |
| F | B, C | 7 | 7 | 150 | 150 |
| G | C | 5 | 3 | 180 | 250 |
| H | D, F | 8 | 6 | 200 | 300 |
| I | E, G | 9 | 6 | 100 | 160 |
| | | + 1400 | | | |

(CPM - 4)
